

一、判断题（每小题 2 分，共 20 分）

题号	1	2	3	4	5	6	7	8	9	10
对错	×	√	×	×	√	×	×	√	√	√

二、填空题（每空 2 分，共 20 分）

1. 0 2. 4 3. -2,1,1 -2 4. 0 $\frac{\pi}{2}$
5. $\begin{pmatrix} 1 & 1 \\ -1 & -1 \end{pmatrix}$ 0 6. $-A-E$ 7. -3

三、计算题（每小题 9 分，共 54 分）

$$1. \text{解: } D = \begin{vmatrix} a+3b & a+3b & a+3b & a+3b \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{vmatrix} = (a+3b) \begin{vmatrix} 1 & 1 & 1 & 1 \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{vmatrix} \dots\dots\dots 5'$$

$$= (a+3b) \begin{vmatrix} 1 & 1 & 1 & 1 \\ 0 & a-b & 0 & 0 \\ 0 & 0 & a-b & 0 \\ 0 & 0 & 0 & a-b \end{vmatrix} = (a+3b)(a-b)^3. \blacksquare \dots\dots\dots 9'$$

$$2. \text{解: 由于 } (A|E) = \left(\begin{array}{cccc|cccc} 1 & 2 & 3 & 4 & 1 & 0 & 0 & 0 \\ -1 & -1 & -3 & -4 & 0 & 1 & 0 & 0 \\ 1 & 3 & 4 & 4 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 1 \end{array} \right) \dots\dots\dots 3'$$

$$\rightarrow \left(\begin{array}{cccc|cccc} 1 & 0 & 0 & 0 & 9 & 5 & -3 & -4 \\ 0 & 1 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 & -2 & -1 & 1 & 0 \\ 0 & 0 & 0 & 1 & -1 & -1 & 0 & 1 \end{array} \right)$$

$$\text{则 } A^{-1} = \begin{pmatrix} 9 & 5 & -3 & -4 \\ 1 & 1 & 0 & 0 \\ -2 & -1 & 1 & 0 \\ -1 & -1 & 0 & 1 \end{pmatrix}. \blacksquare \dots\dots\dots 9'$$

$$3. \text{解: } \because (\alpha_1, \alpha_2, \alpha_3, \alpha_4) = \begin{pmatrix} 1 & -1 & 1 & 3 \\ 1 & -1 & -2 & 3 \\ 1 & 2 & 4 & 6 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & 0 & 4 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix} = (\beta_1, \beta_2, \beta_3, \beta_4)$$

$$\therefore r(\beta_1, \beta_2, \beta_3, \beta_4) = \dots\dots\dots 5'$$

显然 $\beta_1, \beta_2, \beta_3$ 是向量组 $\beta_1, \beta_2, \beta_3, \beta_4$ 的一个极大线性无关组,

$$\text{且 } \beta_4 = 4\beta_1 + \beta_2 + 0\beta_3$$

故 $\alpha_1, \alpha_2, \alpha_3$ 是 $\alpha_1, \alpha_2, \alpha_3, \alpha_4$ 的一个极大线性无关组,

$$\text{且 } \alpha_4 = 4\alpha_1 + \alpha_2 + 0\alpha_3. \quad \blacksquare \quad \dots\dots\dots 9'$$

4.解: 由题知 B 的特征值为 $2, y, -1$

$\therefore A$ 与 B 相似

$$\therefore T^{-1}AT = B, \text{ 即 } -2 + x + 1 = 2 + y - 1, \text{ 亦即 } x = y + 2$$

$$\text{且 } A \text{ 的特征值为 } 2, y, -1. \quad \dots\dots\dots 5'$$

由 $|\lambda E - A| = (\lambda + 2)[(\lambda - x)(\lambda - 1) - 2] = 0$ 知 A 有一个特征值为 -2 ,

$$\text{所以 } y = -2$$

$$\text{从而 } x = 0. \quad \blacksquare \quad \dots\dots\dots 9'$$

$$5. \text{解: 由于 } (A|b) = \left(\begin{array}{cccc|c} 1 & -1 & 1 & -1 & 1 \\ 1 & -1 & -1 & 1 & 0 \\ 1 & -1 & -2 & 2 & -1/2 \end{array} \right) \rightarrow \left(\begin{array}{cccc|c} 1 & -1 & 0 & 0 & 1/2 \\ 0 & 0 & 1 & -1 & 1/2 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right)$$

$$\text{则 } r(A) = r(A|b) = 2 < 4$$

$$\text{从而原方程组有无穷多解.} \quad \dots\dots\dots 5'$$

$$\text{令 } \begin{pmatrix} x_2 \\ x_4 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \text{ 可得特解为: } \eta_0 = \begin{pmatrix} 1/2 \\ 0 \\ 1/2 \\ 0 \end{pmatrix}.$$

取 x_2, x_4 为自由未知量, 令 $\begin{pmatrix} x_2 \\ x_4 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \end{pmatrix}$, 可得导出组的基础解系为:

$$\xi_1 = \begin{pmatrix} 1 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \xi_2 = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \end{pmatrix}.$$

故原方程组的通解为:

$$\eta = \eta_0 + k_1 \xi_1 + k_2 \xi_2$$

$$= \begin{pmatrix} 1/2 \\ 0 \\ 1/2 \\ 0 \end{pmatrix} + k_1 \begin{pmatrix} 1 \\ 1 \\ 0 \\ 0 \end{pmatrix} + k_2 \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \end{pmatrix} \quad (k_1, k_2 \text{ 为任意常数}). \quad \blacksquare \quad \dots\dots\dots 9'$$

6. 解: (1) 先正交化:

$$\text{令 } \beta_1 = \alpha_1 = (1, 1, 1, 1),$$

$$\beta_2 = \alpha_2 - \frac{(\alpha_2, \beta_1)}{(\beta_1, \beta_1)} \beta_1 = (1, -1, 0, 4) - \frac{4}{4} (1, 1, 1, 1) = (0, -2, -1, 3),$$

$$\beta_3 = \alpha_3 - \frac{(\alpha_3, \beta_1)}{(\beta_1, \beta_1)} \beta_1 - \frac{(\alpha_3, \beta_2)}{(\beta_2, \beta_2)} \beta_2$$

$$= (3, 5, 1, -1) - \frac{8}{4} (1, 1, 1, 1) - \frac{-14}{14} (0, -2, -1, 3) = (1, 1, -2, 0). \quad \dots\dots\dots 6'$$

(2) 再单位化:

$$\text{令 } \eta_1 = \frac{\beta_1}{|\beta_1|} = \frac{1}{2} (1, 1, 1, 1) = \left(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \right),$$

$$\eta_2 = \frac{\beta_2}{|\beta_2|} = \frac{1}{\sqrt{14}} (0, -2, -1, 3) = \left(0, -\frac{2}{\sqrt{14}}, -\frac{1}{\sqrt{14}}, \frac{3}{\sqrt{14}} \right),$$

$$\eta_3 = \frac{\beta_3}{|\beta_3|} = \frac{1}{\sqrt{6}} (1, 1, -2, 0) = \left(\frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, -\frac{2}{\sqrt{6}}, 0 \right),$$

则 η_1, η_2, η_3 即为所求的标准正交向量组. \blacksquare \quad \dots\dots\dots 9'

四、证明题 (共 6 分)

证: 设有实数 k_1, k_2, k_3 使 $k_1 \beta_1 + k_2 \beta_2 + k_3 \beta_3 = 0$

$$\text{即 } k_1(\alpha_1 - 2\alpha_2) + k_2(\alpha_2 - 2\alpha_3) + k_3(\alpha_3 - 2\alpha_1) = 0$$

$$\text{亦即 } (k_1 - 2k_3)\alpha_1 + (-2k_1 + k_2)\alpha_2 + (-2k_2 + k_3)\alpha_3 = 0. \quad \dots\dots\dots 3'$$

$\because \alpha_1, \alpha_2, \alpha_3$ 线性无关

$$\therefore \text{有} \begin{cases} k_1 - 2k_3 = 0 \\ -2k_1 + k_2 = 0 \\ -2k_2 + k_3 = 0 \end{cases}$$

解得: $k_1 = k_2 = k_3 = 0$,

故向量组 $\beta_1, \beta_2, \beta_3$ 线性无关. ■6'
